

HERMES SMART CONTRACT SECURITY REPORT

Scan Date:	2026-07-06 14:49:34
Contract Address:	0x595e56402ea22f26f62ed248f102d3034fed0a54
Analysis Mode:	Raw EVM Bytecode Mode
Blockchain Network:	Base Blockchain (ChainID: 8453)

OVERALL SECURITY SCORE

40 / 100

1. Wallet & Token Distribution Ledger

- Top Holder 1 (Deployer): 45.2% of total supply (High Centralization Risk)
- Top Holder 2 (Liquidity Pool): 30.0% of total supply
- Top Holder 3 (Unknown Cüzdan): 12.8% of total supply

2. AI Agent Autonomous Audit Analysis

Wallet Distribution Analysis:

- * **Centralization Risk:** High. Top Holder 1 (Deployer) controls 45.2% of the total supply. This significantly exceeds the 25% threshold, indicating a single entity holds a dominant control over the token supply, subjecting the asset to potential large-scale market manipulation or rug pull scenarios if not locked.
- * **Liquidity Pool:** Holder 2, possessing 30.0% as a Liquidity Pool, is a standard and generally positive distribution for market function.
- * **Unknown Wallet:** Holder 3 with 12.8% is notable but does not present an immediate centralization risk based on volume alone.

Code Level Vulnerabilities:

The provided input indicates "Raw EVM Bytecode Mode" and states "Free API access is not supported for this chain. Please upgrade your API plan for full chain coverage." This implies that the source code is not accessible for direct analysis.

Due to the lack of access to the contract's source code, a comprehensive vulnerability assessment based on SWC Registry standards is impossible. The maximum score for bytecode-only scenarios is 40, as per the scoring methodology. Without source code, analysis for critical, high, medium, or low vulnerabilities cannot be performed. Any assessment would be speculative and not based on deterministic mathematical evaluation.
